

Project Proposal

Inked

The Big Problem

Finding a good book to read is actually very boring and hard right now. Most people just look at the category or the cover but that does not tell you if you will really like the writing. Because there are too many choices people get confused and spend more time scrolling than reading. There is no simple way to find a book based on your current mood or the feeling of the story.

Target Users

University students who want to read something besides their textbooks. Regular people who want a book that matches how they feel like if they are sad or happy. Also people who love cool digital art and nice designs.

The Main System

I am making a mobile app called Lit Vibe using Flutter. Instead of looking at boring lists users can pick a vibe like dark or funny or deep. The app shows a famous quote from a book on a simple card. You cannot see the name of the book yet. If you like the quote you swipe right and the app reveals the title and the author.

Amazing Core Features

Mood Driven Search

This is super cool because you do not search for a genre. You pick how you feel like being sad or feeling powerful. The app then shows you quotes that match your current energy perfectly.

The Secret Quote Swipe

This is like a blind date with a book. You only see a deep quote and nothing else. You swipe based on the words alone and if you match the book name is revealed like a surprise.

Instant AI Art Bookmarks

This is the best part of the app. When you find a book you love the app uses AI magic to make a one of a kind digital bookmark. It mixes the quote with beautiful art to make a wallpaper that only you have.

The Aesthetic Library

A very pretty place in the app where all your matched quotes and AI art are saved. It looks like a digital art gallery of your own reading style which you can show to your friends.

Objectives

I want to make it easy to find books based on feelings instead of just titles. I also want to help students enjoy English literature by making it look modern. The app will give people cool AI art as a reward for using it. My goal is to finish a real app that works perfectly on a phone.

Type of Database

I will use MongoDB for this project. This is a NoSQL database which is perfect because I need to store many different things like long quotes and links to images. It is much easier to use than regular SQL for this kind of creative app because it is flexible. I can add more categories later without any big problems.

The Plan to make money

The main app will be free for everyone to use. If someone wants special art styles for their bookmarks they can pay a small one time fee. I will also put a button in the app to buy the books from local bookstores here in Pakistan. This way the app can make a little bit of money from those sales.
